ABSTRACT

ŧ

Apparatus and methods include various means of increasing the finish gloss of a
printed image that is formed on a sheet of media by a deposition device. Apparatus in
accordance with the present invention include a fusing circuit that enables the image to
be repeatedly exposed to the heat of a fusing device while passing the media through
the deposition device only once. Apparatus in accordance with the present invention
can also include a fusing device that has a single hot roller and a plurality of pressure
rollers that enable the image to be passed between the hot roller and each of the
respective pressure rollers in succession. A method in accordance with the present
invention includes repeatedly exposing the image to a fusing device.
